**AQA
AS & A LEVEL**

**3.7 Fields and their
consequences (A-level
only)**

www.exampaperspractice.co.uk

- 1 A [1]
- 2 (a) work done per unit mass in bringing object from infinity to point
 B1
 potential at infinity zero by definition
 B1
 work has been done by the field so potential at all points closer than
 infinity negative
 B1 3
- (b) use of point on graph allow within \pm small square
 C1

$$\frac{GM}{r}$$
 substitution into $V = - \frac{GM}{r}$
 C1
 range from 590 – 6.90×10^{24} (kg)
 A1 3
- (c) (i)
$$\Delta E_p = -\frac{GMm}{R_E + h} + \frac{GMm}{R_E}$$

 C1
 addition of radius of Earth to give 7.25×10^6 (m)
 C1
 1.54×10^{10} (J)
 A1 3

(ii) equates $\frac{mv^2}{r}$ and $G \frac{mM}{r^2}$

C1

to give $\Delta E_k = G \frac{mM}{2} \left(\frac{1}{r_1} - \frac{1}{r_2} \right)$

C1

$1.25 \times 10^9 \text{ J}$

A1

positive or increase

B1

4

(iii) (lower altitude so) gpe decreases ke increases

C1

loss of gpe is twice gain in ke

A1

2

[15]

3. D [1]

4. B [1]

5. D [1]

- 6 (a) zero potential at infinity (a long way away)
 energy input needed to move to infinity (from the point) **B1**
- work done by the field moving object from infinity
 potential energy falls as object moves from infinity
- (b) Any pair of coordinates read correctly **B1**
C1 2
- ±1/2 square*
- Use of $E_p \text{ or } V = (-) \frac{GM}{r}$ **C1**
- Rearrange for M*
- $6.4 (\pm 0.5) \times 10^{23} \text{ kg}$
- (c) Reads correct potential at surface of Mars = -12.6 (MJ) **A1** 3
C1
- or reads radius of mars correctly (3.5×10^6)*
- equates to $\frac{1}{2} v^2$ (condone power of 10 in MJ)
- C1**
- use of $v = \sqrt{2GM/r}$ with wrong radius*
- $5000 \pm 20 \text{ m s}^{-1}$ (condone 1sf e.g. 5 km s^{-1}) **A1**
- e.c.f. value of M from (b) may be outside range for other method $6.2 \times 10^{23} \times \sqrt{\text{their } M}$* 3
- (d) Attempts 1 calculation of Vr **B1**
- Many values give 4.2.... so allow mark is for reading and using correct coordinates but allow minor differences in readings*
Ignore powers of 10 but consistent
- Two correct calculation of Vr **B1**
- Three correct calculations with conclusion **B1** 3
- [11]

7 B

[1]

8 C

[1]

9 A

[1]

10 A

[1]

11 C

[1]

12

- (a) (i) (Minimum) Speed (given at the Earth's surface) that will allow an object to leave / escape the (Earth's) gravitational field (with no further energy input)

Not gravity

Condone gravitational pull / attraction

B1

1

(ii) $\frac{1}{2} mv^2 = \frac{GMm}{r}$

B1

Evidence of correct manipulation

At least one other step before answer

B1

2

- (iii) Substitutes data and obtains $M = 7.33 \times 10^{22}(\text{kg})$
or
Volume = $(1.33 \times 3.14 \times (1.74 \times 10^6)^3$ or 2.2×10^{19}

$$\text{or } \rho = \frac{3v^2}{8\pi Gr^2}$$

C1

3300 (kg m⁻³)

A1

2

- (b) (Not given all their KE at Earth's surface) energy continually added in flight / continuous thrust provided / can use fuel (continuously)

B1

Less energy needed to achieve orbit than to escape from Earth's gravitational field / it is not leaving the gravitational field

B1

2
